

BRAINSTORMING

Project Title

Import Data Using Transform Maps

Project Overview

The project focuses on importing employee data into the ServiceNow platform using Import Sets and Transform Maps. The main idea was developed by identifying the difficulties involved in manually entering a large amount of employee information into a ServiceNow table.

During brainstorming, different approaches such as manual data entry, direct record creation, and automated data import were discussed. Manual data entry can be time-consuming and may result in incorrect or inconsistent information.

The selected solution is to use ServiceNow Import Sets and Transform Maps. Import Sets are used to bring external employee data into ServiceNow, while Transform Maps are used to map the source fields to the corresponding target table fields.

Objectives

- To import employee data into ServiceNow.
- To reduce manual data entry.
- To map source fields with target fields.
- To understand the working of Import Sets and Transform Maps.
- To verify the imported employee records.
- To demonstrate a structured data migration process.
