Field Mapping

↓

Target Employee Table

↓

Verified Employee Records

Explanation

The employee data is initially available in a CSV or Excel file. The file is uploaded into ServiceNow using Import Sets.

The imported data is temporarily stored in the Import Set table. The Transform Map defines how each source field should be transferred to the corresponding target field.

After the Transform Map is executed, the transformed employee information is stored in the target table.

Finally, the imported records are verified to ensure that the data has been transferred correctly.
